

Press release (Trade Media)

Tec Ties launches new range of internal head restraints

One of the UK's leading wall tie manufacturers, Tec Ties, have introduced internal head restraints into their range aimed at building and construction companies and brickwork contractors.

The company, based in Derbyshire, believes that the new products are better engineered than other similar products on the market and will give more rigidity and reliability.

[The Tec Ties Internal Head Restraint \(TTIHR\)](#) is designed to restrain the top of the inner leaf of cavity walls.

It allows vertical movement between the inner leaf and the structure by using a rectangular sleeve which sits in the vertical joint and a top section bolted to the soffit designed to slide within the sleeve.

[The Tec Ties Internal Head Restraint \(TTIHR\)](#) is available with three head options i.e. slotted, 10mm hole and 6mm hole. The

standard Tec Ties Internal Head Restraint (TTIHR) is supplied to suit a standard block but specials can be made to suit site requirements, says the company.

Full technical details are available in a pdf downloadable brochure [here](#).

[Bob McGrouther](#), National Sales Manager, said: "We are continuing to expand our product range with innovative and better designed products. The Internal Head Restraints along with Sliding Anchor Stems and Channel Systems widens our market appeal to users in the industrial and commercial building sectors. They are a welcome addition to our "tangle free" range of cavity wall ties offering cost and safety benefits to construction companies and brickwork contractors across the UK."

The new internal head restraints complement the company's sliding anchor stems which were launched about two years ago.

[Tec Ties' sliding anchors](#) have 25 x 5 mm stems and are designed to fit within the cavity using one way or two way safety ties that slide to accommodate vertical movement when restraining cavity walls to overhead structures.

They are available with seven different head options complete with 12 mm diameter fixing holes to suit M10 single Expansion or M10 T Head Bolts. The TTSAC version has proved the most popular, says Bob.

Again, full technical details for the sliding anchor stems are available [here](#).

Based in Hurstfield Industrial Estate at Hague Bar, near New Mills, Tec Ties manufactures a comprehensive range of construction fixings, including [tangle free wall ties](#) and distributes its range of products primarily through builders' merchants across the UK.
